

TRAFFIC ENFORCEMENT SYSTEMS

CCTV catches distracted drivers

Microbus has recently supplied Traffic Enforcement Systems Ltd with M-PC2 In-vehicle PCs to be used as part of their specialist mobile CCTV solution. TES installs the Microbus PCs in purpose-built Smart cars along with other e-compliant equipment which adhere to police standards requiring no interference. Cars come with a GPS receiver so locations can easily be verified; top models are able to transmit co-ordinates back to a web-based server.

These fully CCTV-equipped vehicles are available for rental by local authorities to enforce moving traffic offences and effectively police accident hotspots and traffic problem areas.

Camera control and recording is controlled easily through the computer's OptiVue™ touchscreen which is mounted neatly into the dashboard.

Vehicles are already in use at a number of local authorities including Camden and Westminster.

In developing the solution, TES had tried various Digital Video Recorders that are on the market as well as other best of breed products but chose the M-PC2 with its integrated digital video recorder.

Clive Paul, Managing Director of TES said, "With the Microbus M-PC2 we found that elusive product. We not only found a product that satisfied our immediate needs we also found a product that would grow with our ambitions, and dare we say it, be future proof. Service and technical support are quick and efficient and most importantly the service doesn't stop after delivery."
